

No that is for No Demand or No Supply, not demand swaping supply. Demand swamping supply is always a higher volume bar typically you will see a close close to the middle. Volume less than previous two would make this bar a NS or test typebar. You see the volume coming in and if it was all selling than the close would be or should be on the low and not at the middle, therefore it is assumed that demand has swamped the supply creating this type of bar printed. The next bar being up confirms the hidden buying.

You really seem to have your definitions mixed up and are confusing high volume bars with low volume bars. Time to hit Master the Markets again to get the bar types straightened away. Until you get some of the basic bars like SO, UT, ND, NS or tests clear in your head VSA will seem like a foreign language and you will struggle to read the charts.
