

## dove\_alliance :

I am going to explain this one more time;

You have 3 trend indicators.

1. ROMAR - Chart trend indicator.
2. EMA - 4 Horsemen cycle indicator
3. Parabolic - 4 horsemen trend indicator.

I am using the H1 chart as an example because what I will explain is exactly the same on the H2 and Daily.

On this screen shot below you have ROMAR as support. It remains as SUPPORT until it crosses EMA - then it becomes RESISTANCE. This is the only time EMA and ROMAR are related is with the crossing.

On the Left side you have EMA crossing Purple with the Parabolic flip which placed EMA as support which had placed this chart in a full blown uptrend with ROMAR, EMA, and the Parabolic in an uptrend as support.

On top you have EMA crossing Purple with the Parabolic flip as RESISTANCE and ROMAR as support. Because the Parabolic is the power with the 4 horsemen in trend; ROMAR will be broken as shown on this screen shot.

The chart displays price fluctuations over time. Key annotations include:

- ROMAR Crossing EMA (RESISTANCE)**: Occurs around March 2017.
- EMA Crossing Purple (SUPPORT)**: Occurs around May 2017.
- ROMAR sliding under EMA (SUPPORT)**: Occurs around August 2017.
- EMA Crossing Purple (RESISTANCE)**: Occurs around November 2017.

Jun 27, 2017 – pg 504

Hello Traders

Here is the trade I took this morning (on GBPUSD):

i	OSRUSO	Buy	27/05/2017 12:30:15.946	1.27281	1.27716	43.5
---	--------	-----	-------------------------	---------	---------	------

Jun 29, 2017 – pg 507

White crossing Purple does not eliminates the TREND nor puts the market in consolidation. All it does is eliminate the power of the Parabolic in **consolidation**. The only thing that eliminates the Trend is the H2 Parabolic flip. It is then you are in consolidation and you can trade both ways.

+++++

Hendo

Although I have started to focus trading another pair, I keep up with the thread to help anyone who may be struggling a bit, with anything I feel would be of benefit to all. With that said I still do a Daily EJ plan, and sometimes for every session I can trade, just to stay sharp. I cannot stress how important the plan is. When done right, and the rules are properly applied you cannot loose with this system. Worst case is BE, and usually after that happens, another +40 opportunity presents it's self. The Paradox presented this opportunity, and it was to good to pass up.

Session New York: EUR - JPY 6/29/2017

Notes: Four Horsemen up. DB with GREEN and MAGENTA DIVERGENCE attach 87 pips above 0.00 FIBO. Trend EMA arrow up. MACD zero cross arrow up. FIBO down.

Notes: Four Horsemen up. Purple crossed White down. EMA holding support. DB / SAR with GREEN and MAGENTA DIVERGENCE attach at 0.0 FIBO. Trend EMA arrow down. MACD zero cross arrow down. FIBO down.

Final Notes: H1 down, ROMAR trend up. H2, Daily in sync with up trend. I will enter long position off H2 support. Looking for H2 SAR hit to reenter up trend.

Result: Took +40 from the market.

+++++

dove alliance :

The Parabolic flip is not locked in until the closing of the BAR. We still have 45 minutes on this bar which means the Parabolic can lose its position and return for the uptrend. So you must wait on the next bar for the Parabolic to be locked in. That is the rule.

[illegible]

Jun 30, 2017 – pg 510

dove\_alliance :

To finish up the scenario from last night we are now in consolidation. This is known as an up consolidation because ROMAR still has the power for the uptrend. What had turned the market into consolidation was the flip of the Parabolic which is now resistance.

Once you begin to apply the rules with the Paradox is when you begin to apply the power with your trading. You cannot analyze the Paradox; if you do then the Paradox will eat you alive. The bottom line is you must know all the rules to beat the market. The 4 Horsemen, along with EMA, are now resistance with ROMAR holding support. And there are a set of rules to trade this kind condition which include the DB and the SAR.

+++++

On this H2 bar you have the Parabolic flip with EMA at Purple for the crossing. You also had the White crossing in **consolidation** which eliminates the Parabolic's power. The white crossing also verifies either a slider or a reversal. You also had the SAR attached with the Parabolic downtrend. On the next bar you had the smooth crossing which verifies the reversal. On this bar you had the Parabolic flip.

Now - with the rules I had given you what is the Paradox saying to you at this moment.

I also wondered how many of you jumped on the DB/SAR for the up at the bottom with the BB. That entry had traveled 80+ pips at this time.

+++++

## Quoting SolitudeFx

I believe this the rule applied. "If Smooth crosses Purple on the same bar or the next bar of the White crossing then you are looking at an automatic turn."

That is correct and you had two confluences to go with it. You had ROMAR for the power of the uptrend on all three charts plus - DB/SAR in consolidation connected with the power of ROMAR. That DB/SAR was the actual entry for the long. What we had was a swing in the uptrend. You also had another entry within this swing which was the hit on EMA/Smooth for the short using the Parabolic trend. And all this information is on H2 chart.

[illegible]

Jul 1, 2017 – pg 512

dove alliance :

Let me give you a reference to study which is Divergence on the H2:

Two weeks ago we had a breakout and prior to this breakout, and for a just over a week, we were in a ranging mode with the H2 ROMAR with the H2 lower Divergence. What started the Ranging between the ROMAR and Divergence was the hidden divergence showing on the H2 with the Main divergence. That is what started the H2 DB in this ranging mode. if you go back to June 7th You will see the Hidden Divergence attached from the last low. From that point the DB was in action. When the H2 hit ROMAR the DB attached and reverse to connect with the Lower Divergence. This continue going into the following week.

The question is: When will you know the breakout will happen. The breakout happens the same way it began; with the Hidden Divergence and DB. If you look on June 15th you will see the DB with the Hidden Divergence showing for the breakout. The is when Both DB/SAR will follow the uptrend with the SAR breaking out to reconnect with the support of EMA and/or the Parabolic of the trend for an entry back into the trend.

In consolidation the Hidden Divergence plays a major role with the DB for entries and exits. In trends they both will run with the trend. In trend is when the SAR plays the role of getting back into the trend.

Jul 3, 2017 – pg 514

Today I was going to make a post of the Double Top and Double Bottom and was not able to get back to my office until now; and notice Adaptation had made an entry.

This up trend had began on June 23rd with the H2 Parabolic flip at the opening price of 124.212. It travel 460.8 pips and closed with a high of 128.820. It turned and headed south and gave up just under 140 pips with the Parabolic flip and then stop mid-term for a swing; and headed north again. This means you had just under 140 pips from the low of the turn at 127.430 to the high 128.820 of 139 pips. If the market breaks 128.830 it is not a higher high - but a Double Top. And why it becomes a Double Top is because the Parabolic NEVER flipped from 124.212 to the top of 128.830; and because there was no flip of the Parabolic then the top is the HIGH.

Once a high is created very seldom you will get a Double Top on an uptrend. Usually it will turn and head south to create a new low. Same thing on a downtrend.

So what does this mean?

As a general rule a Double Top is giving heads up for a turn in the future for a lower low. Same thing on a Double Bottom - higher high. That my friends; is part of the Power with H2 Parabolic. Letting you know what is happing from trend to trend.

Bottom line - because of the swing a Double Top was created. Remember this scenario in the future as for the Pip Count to the previous High on an uptrend; and the previous low of a downtrend.

The reason for the higher high is because there was no flip on the H2 Parabolic. The reason for the Double Top was because of the Swing. And the general rule on a Double Top is a reversal. This does not happen often; but when it does you now know what is happening.

I believe this is my first post on the Double Top and Double Bottom. If you get a Double Bottom the scenario is the same. It is not often you get ROMAR with such power with a swing. Most times ROMAR is tracking center on a turn. But this time ROMAR was deep in the valley. If ROMAR was closer to the low I could pretty much know what it will do from here. At this point I would not give my thoughts as I really do not know for sure. But - as you can see the H2 is setting up for the White crossing and you know the rule on that crossing.

Jul 3, 2017

Well traders - it is doing exactly as I said it would do and I apologize for not posting it sooner. But I was just too busy and could not break away. But any time you come across this situation and scenario; especially when the market is trying to break the Double Top or Double Bottom - just be patient with it. Once it turns it will go.

+++++

shinny:

Hello Traders

As Dana was saying, that particular scenario is not one that happens often and takes a bit of recognising. I saw what was happening and went short at the top. My entry wasn't perfect but when these things go they usually go.

I noticed this scenario through many, many hours of scrolling and wondering why sometimes the market just turns. I even checked news events on these days to see if it was news related, sometimes there was news and other times there was not. So thanks Dana for clarifying this for me in relation to the Parabolic. In futures trading you see this pattern a lot - higher right high, and lower right low, and just about everytime after, the market moves very quickly the other way.

Here is my 2hr chart with entry (at the open of the arrow down):

And screen print:

#### Quoting Retroque

Just to clarify crystal clear, where was the correct entry for this scenario, was it the open below smooth, or Shaun's entry or the open with purple at smooth for the crossing verifying the automatic turn? Or other I haven't mentioned?

Personally, I prefer under Smooth. You have White/Purple crossed or ready for crossing, which is giving you some confirmation that the market isn't going to push higher, at least until after a decent retracement.

But I was going to bed, so entered!

dove\_alliance :

Quoting Retroque

## Quoting Retroque

Just to clarify crystal clear, where was the correct entry for this scenario, was it the open below smooth, or Shaun's entry or the open with purple at smooth for the crossing verifying the automatic turn? Or other I havent mentioned?

On the uptrend it is the close bar beneath Smooth and on the downtrend it is the close bar above Smooth for the entry.

Jul 6, 2017 - pg 517

dove alliance :

OK Gentlemen and Ladies:

With the uptrend we had the Parabolic keeping the uptrend intact with higher highs. The double top came into existence when the market had gone a few pips higher high and then with the Parabolic flip. The market then went into a swing. The low it created was the beginning of the ranging mode. Because of ROMAR having the power for the up it created a higher high for each mark of the High. And for each mark of both high and low the DB/SAR had also marked those positions.

ROMAR is now in the trading area and still has the power for the UP with DB/SAR on top for another low. This is where the Game begins. Today is Thursday and I would say by tomorrow we will have a breakout. I will not give you the breakout but for you to study into how the breakout works itself into this position. This way you will never forget..

Jul 12, 2017 - pg 525

dove alliance :

I am curios of how many traders can tell me the rule for entry going short or long for a swing or reversal?

+++++

pg 527

## Quoting Adaptation

If smooth crosses purple on the same bar or next bar of the white crossing, then buy or sell a pullback to support or resistance

Close - it is not a pull back but the actual entry going short from a long or a long from the short..

If White is AT the crossing of Purple and on the Next bar Smooth is AT the crossing of Purple; you have an entry and 90% of the time the **open** candle is below EMA for short and above EMA for the long. On sliders it is the same with White and Smooth. If you do not get White/Smooth crossing in sequence then it is a slider. At the end of the slide the sequence is in place for entry..

There is so much more like this that are NOT in the documents. If you traders want to be winners then I suggest start reading everything on this thread and learn about ALL you have been missing.

[illegible]

Jul 14, 2017 – pg 528

dove alliance :

I have been debating this decision for about a week in giving this 4 hour chart. The 4 hour chart is not a trading chart but will replace the Daily as for reference with support and resistance. The H4 is stripped down for reference only. The EMA signal, Arrows, and MACD is not on the H4.

The reason for debating is because some of you, if not all of you, would want to add indicators to the H4 and would be a bad mistake in doing so. If you use the H4 as you would the Daily then you have a great reference with ROMAR, EMA, and the Parabolic's between the H2 and H4; and the H4 could give you a good reference with entry with the H2 as for the DB/SAR being delayed on the H4 comparable with the H2.

My decision was based in helping those that are having difficulties in recognizing sliders. The H4 might be able to help. Another reason is because of the delay on the H4 as for support and resistance and could help you on entries with the delay..

On your trading plan you can add the H4 below the Daily and reference Support and Resistance on the H4 instead of the Daily. The H2 is still your Trading Chart and not the H4.

+++++

## Quoting miau1

I got a question; if for example H1, H2 and D1 were trending and H4 was in a different trend, would it still be considered a trend scenario?

This is why I debated for so long because of traders trying to add something. All the RULES remain the same. AS I HAD STATED - the H4 is ONLY for REFERENCE on SUPPORT AND RESISTANCE.

+++++

Date and Time in creating your plan:

This is relevant because if you do not create your plan at the Opening of the new data at 17:00 ET, and create your plan sometime after the 17:00 ET; you then must reference the new Data.

The problem most traders are having is how the MT4 does not recognize the 17:00 Daily Bar chart. You get the spread before the 17:00 Bar for the currency exchange and then new data at 17:00 ET. This means at 17:00 the Daily and all other charts are receiving new data; even if the bar is still running from the H2 chat and up at 17:00 ET.

You have to adjust your trading plan accordingly with the chart time. This means; in order to use the H4 chart properly it must be in sync with the H2 support and/or resistance.

Example:

On today's closing you have ROMAR on the H2 as resistance. On the H4 ROMAR is support. In this scenario you have a ranging marks with ROMAR on each chart.

On today's closing you have both H2 and H4 Parabolic's as resistance with EMA as resistance on both charts with the H4 EMA in a slider.

On today's closing you have the H4 SAR on top at 129.509 and the H2 SAR on the bottom at 128.579. The DB on the H4 at 128.483 with the H2 DB at 128.483.

If you are to use the H4 in recognizing support and resistance you have to always remember the H2 is the power chart. So – I will repeat – the H4 is not a trading chart.

H4 is to be used as a leverage for support and resistance especially in consolidation and ranging between support on one chart; and resistance on the other. If you use the H4 properly you will see trades you haven't recognize before with S/R on the H4 coinciding with the H2. The Parabolic is a great example on both charts at closing with ROMAR as support on the H2 and resistance on the H4. Another example is with the SAR on Thursday evening with the hit on both charts for the short with H2 ROMAR as resistance and the H4 EMA as resistance.

Jul 18, 2017 - pg 530

dove alliance :

Traders - throughout every single postings I had posted was strictly about the POWER OF THE H2 CHART. The 2 hour chart is the leader of everything about the Paradox. When I reference another chart in my postings it has to do with the **H2 Chart**. What I am finding daily is all traders do not know how to; or refuse too - **THINK OUTSIDE THE BOX**. The Paradox was not created to analyze but to **READ** what the H2 is saying.

I trade the 2 hour chart as a stand-alone. I do not need any other chart to reference as it tells me everything it is saying from bar to bar. In other words - whatever the H2 is saying; it is also saying on the other charts, may it be support, or resistance, or trend, or ranging, or any other scenario that has been taught. The H2 leads and the others follow because Support, Resistance, and Trend never changes within the Paradox but always remain intact on all charts..

If you are not thinking outside the box then you had missed the boat.

[illegible]

Jul 19, 2017

dove\_alliance :

## Quoting jakdan

trade evaluation: took +40 from the market. H2 downtrend looked strong went short off purple in the moment, market did go to white but didn't want to miss it in waiting for 7.00am candle. only doubt was the daily EMA support however the H2 looked strong so took it.

This was an out of the box entry with confluence of the indicators all on the H2 chart.

1. EMA Red Arrow going short
2. MACD zero crossing Arrow going short.
3. Retrace to Purple Resistance for the short.
4. EMA crossing Purple for the short.
5. Parabolic locked in for the downtrend.

Even though Jakdan didn't know it - his entry was totally out of the box and immediately went into profit for his 40 profit.

This out of the box entry had forced ROMAR to follow through with a switch of trend instead of a slider going through center. Study Jakdan entry chart and you will see how the H2 Chart dominates the Paradox. I need not say more.

[illegible]

Jul 21, 2017 - pg 532

dove\_alliance :

At this time I would like to use Adaptation as an example of what every trader should be doing.

In the beginning, Adaptation was asking a lot of questions that had already been answered. His first posting was June 3rd of this year introducing himself and stated he has already been studying the Paradox for about a month. But the questions kept coming and he was constantly guided to study the system and his questions would be answered.

It was not until I made it a requirement to post the rule(s) for the entry on all trading plans did his attitude changed. It was a light bulb moment knowing he would never learn unless he knew the rules of trading. And from that moment on - and with every trading plan entry - he posted the rules for his entry.

It was difficult for him because each scenario has its own rules. So I told him to study the scenarios, and the rules that belong to each scenario, and he would get a better vision of what was happening. But mostly - learn patience on waiting for the market come to him; and not chase the market..

Little by little, Adaptation was achieving his goal in learning how to trade the Paradox by applying the rules for each scenario. He has a ways to go but one thing is for certain; he will be one of the 5%. The reason is because he has the heart in learning.

His last trading plan was astounding in the way he had seen resistance and not to go long. But he waited for the short - knowing going short was the trade - and took the trade according with the rules. There was no-way he could had seen the resistance if it was not for studying and placing his heart into studying,

Adaptation got a lot of complements with his trade and deserves everyone of them. I had seen the resistance before I read Adaptation trading plan. And to be honest; I was impressed with his trading plan in seeing the resistance, and astounded with his entry going short. For me - that was impressive and had shown me that one day he will be one of the great ones.

One great thing about Adaptation; he is humbled and I also believe he walks in faith. I suggest in each of you learn from Adaptation attitude of learning. If you do - then you too can reach a goal of being one of the great ones.

Jul 22, 2017

dove\_alliance :

What is a Paradox?

Definition in English language is:

a :something (such as a situation) that is made up of two opposite things and that seems impossible but is actually true or possible.

b :someone who does two things that seem to be opposite to each other or who has qualities that are opposite.

c :a statement that seems to say two opposite things but that may be true.

A paradox is often used to intrigue and question common thoughts. Take the statement "Less is more." This statement uses two opposite words that contradict one another. How can less be more? The concept behind this statement is that what is less complicated is often more appreciated.

In the terms of trading the Paradox is a mathematical rectangular organization of numbers that is used to make various calculations; in short - the Paradox is a linear transformation from what is false to what is true. And because of this transformation it is a Matrix. As TraderMarcos had stated: The rules are set in stone.

As I have stated time and time again: The Paradox is by no means standard. The Matrix that is built within the Paradox has a set of rules that will guarantee 100% entries and exits; and is known as the Matrix group consisting of a set of mathematical objects together with a binary operation, that is, an operation combining any two objects to a third, subject to certain requirements which are the rules for each combination.

What this means you have to be part of the Matrix in order to beat the market. And in order to be part of the Matrix you HAVE TO KNOW ALL THE RULES of the Matrix.

So the question is: What makes the Paradox truth? The answer is very simple. The mathematical structure of the Matrix which are generated into the RULES brings forth the truth.

So you may know 60% of the rules with the Matrix on this thread are NOT IN THE DOCUMENTS. I suggest for those who have not yet read this thread then begin today and read EVERY SINGLE POST and write up a journal of everything you have missed; and study in how to trade the Paradox within these rules of the Matrix. If you don't then you are wasting your time. There is not one question you have is not posted on this thread.

Jul 26, 2017 - pg 535

dove\_alliance :

Traders - when you get a double high or double bottom always prepare going into a ranging mode. The beginning high of the top is usually the next high low in the top mode; as the picture showing below. It is vice-versa in a double bottom. On a top it can created a new top but do not depend on that scenario. If you do not have the pips - then do not take the trip.

+++++

shinny:

Hello Traders

I've read through the recent thread again and would just like to back up what Dana has said regarding the documents.

**I've read the docs, and I'm not making a \$Mil/per week, what happened?**

The documents were started as a weekly summary of the posts, and were kept up a good while, and thanks to the guys who did it. But like Dana has recently said and has also been said many times - the documents are not the be all and end all.

We have done certain docs on subjects, but they do not encompass the whole thread.

The be all and end all is the thread.

If you really want a document - create your own! I have created my own document, running to many, many pages, which I update and read regularly. And before you ask, no I am not sharing it. Do your own work!

It will take you a LOT of work to do this but it is the only way I know to efficiently learn the Paradox. No Short Cuts. Create a document and then you can search that document (in .doc or whatever) and then you have at your fingertips the whole database.

You can then (as a recent graduate has done) compile each scenario and the rules.

Jul 28, 2017 – pg 536

dove\_alliance :

In a ranging mode support and resistance are not as strong as it would be in either trend and consolidation. The SAR is what you trade in ranging with the DB attaching. What this means is you trade the SAR from the position of the DB. If the DB is on top you trade the SAR from the top. If the SAR is on the bottom then you trade the SAR from the bottom. As an example:

DB and SAR on top together. The SAR breaks loose and attaches on the bottom. This is where patience is critical; most times there are not 40 pips back to the top. So wait on the SAR to reattached on the top and take entry for the short and the reason is because the DB will then attaches with the SAR on the bottom. Vice-versa for the long.

[illegible]

Aug 1, 2017 – pg 539

dove\_alliance :

On July 26th I said we were in a ranging mode and made this posting:

*"Traders - when you get a double high or double bottom always prepare going into a ranging mode. The beginning high of the top is usually the next high low in the top mode; as the picture showing below. It is vice-versa in a double bottom. On a top it can created a new top but do not depend on that scenario. If you do not have the pips - then do not take the trip."*

I gave the high and after the low was established with a double bottom I also posted that scenario with the new SAR on top giving the ranging marks of 100 pips.

NOW -

I am continuously getting postings when the breakout will happen. And I continue scratching my head wonder after the answer was given - there is not anyone can get it?

You got the high and the low with the double top and double bottom so why is it so difficult where the breakout will happen. I stated very clearly the breakout can happen going either direction. And the reason why everyone is missing this is because my postings are not being read properly or totally ignored.'

Generally I don't do this because if you don't want to learn then that is your problem. But for the benefit of those who are learning; here is the screen shot of the high and low of the ranging marks.

[illegible]

EURJPY	Day	02/06/2017 06:35:20.467	130.328	130.753	425
--------	-----	-------------------------	---------	---------	-----

dove\_alliance :

I kept saying the breakout could go either way because there was not anyone seeing the breakout or else they would had said something; especially on a trading plan. Last week the breakout was showing very clearly on the Daily with a full blown uptrend. Most of my trades were off the bottom because the breakout was going north.

Now - how is the breakout to be recognized and when? Very simple - applying the rules. With Shaun's entry you had the H1, the H2, the H4, and the Daily all sync for the up. That is a very powerful confluence with the previous DB being short of the double bottom and ROMAR holding support on the H2. ROMAR was the signal for the breakout in holding support in that moment.

[illegible]

Aug 3, 2017 – pg 540

# Hello Traders

Just following up from what Dana said earlier, here is my trade from today on EJ:

As Dana explained the market was out of balance so I was looking for the short, given the opportunity. If I wasn't around for the short, I would wait for a possible long from Daily Purple, with 4hr/2hr Support.

I took the trade on the open bar on my chart screenshot.

Given what Dana has already said, I think its pretty self explanatory!

+++++

### Quoting ilpoj

I also did a sell entry at 130.960, on the 2H open bar that opened below EMA and between the EMA and the (eliminated) Parabolic. Too bad my TP was 130.560, which was 1 pip too far because of the 2 pip spread, and the trade is still running :-P By the way I was reading this post number 8558 by Dove that says: "If ROMAR is support and the DB/SAR are resistance then ROMAR is your target." And that quoted example case was in the scenario of a 2H chart and a downtrend.

Hi

Here is the 2hr chart again:

The blue rectangle box shows the failed high after the break out. As soon as Smooth/Purple/White cross you can get in very safely, and because of the speed at which they crossed you can be sure that EMA/Purple will cross, and quite often you will have your +40 on the same bar the PSAR flips (as happened in this case).

Your getting in safely near the top and not having to wait for either a SAR on top at the PSAR or just a bar to close near the PSAR to get in.

+++++

### dove\_alliance :

My Lord had told me once: "Always stay strong in what is predictable. If you do, then your knowledge, wisdom, and your emotions will also be predictable".

**Anything that you can see or know before it happens is *predictable*.**

Whatever is predictable in life will also control everything else about yourself. You are then in control of all encounters of life because you are predictable and nothing can stand in your way; nor change anything about you. If you are unpredictable then anything in life can change your esteem and also your faith.

It is the same with trading. Why do you think we are trading the E/J? The reason is because the E/J is the only pair in the market that is Predictable.

The best way in learning is educate yourself about the scenarios in back testing. Take one scenario and learn the rules. Then back test 6-8 weeks and hunt down the scenario and study each one of the scenario as you are going through the weeks. Once you have that scenario down then move on to the next scenario and do the same. But the question is: how many of you have the desire and the heart of spending your free time during week-ends in learning and knowing thyself in this way?

Shaun's quote on his postings says it all: "*Nobody can be told what The Matrix is. You'll have to see it yourself*". In order to see it yourself you have to be the Matrix in knowing thyself.

Aug 4, 2017 - pg 541

Hello Traders

  - Volume: "128.407".
- Bottom Panel:** A volume or order flow chart showing blue bars. The text "PnL (2) (11.34.5) 0.020 0.020 0.007" is visible on the left, and "01:46:57" is on the right.
- Bottom Status Bar:** "EURUSD", "Date", "04/08/2017 13:20:05.110", "170.578", "171.078", and "45.6".

The trade is the second arrow from the right, at 2hr ROMAR. I opened that trade in the expectation of what was going to happen, following the power of the Paradox.

The reason why I said that I knew what was going to happen, and Dana also did a great post about prediction, is that the market had hit the 2hr Support (ROMAR), but looking at the 4hr, EMA/PURPLE crossed down at the same time, and pretty much always if that happens you are heading for 4hr ROMAR, which the market is now doing.

How can you trade in the moment and also be able to predict what is going to happen? That is of course a Paradox, but what Trading In The Moment means is using everything that is in front of you and trading that information but not letting what you think will happen get ahead of you. You trade what is there NOW, but knowing what will happen in the future. Quite a Paradox, but very important to be able to do.

Remember, Dana gave you the 4hr chart to help you with S/R, its a great chart and will keep you on the right path if you learn how to use it.

Aug 24, 2017 - pg 552

I had that problem being bias on the short for the longest time. I had to learn in seeing the charts with a new perspective being objective with both trend and S/R. I had found the Daily Chart gave me the trend along with Support and Resistance; and the lower charts verify what the Daily is saying. This had finally took away my biasness because I then began seeing the trend both ways between support and resistance in all scenarios. I have given this advise throughout all my training:

- Once you have set your emotions trading both ways then the visuals will become much more clearer.

Aug 24, 2017

*"The Daily ROMAR is still up and we are in a ROMAR ranging mode with the Daily outside the trading area. Opening on Sunday we had an open H1 above ROMAR and had already crossed Purple for EMA and entry going long. Yesterday we had an opening with ROMAR as support in a slider under EMA going long. And because of the sequence with ROMAR beginning with the H1 had placed the H2 in both support/resistance with the H4 ROMAR as resistance. All because of the Daily ROMAR being Support with the sequence. And this will continue until the Sequence is in order for a breakout."*

This statement had clearly described in how the ROMAR works in a sequence for all charts. This means the Focus for the long is beginning with the H1 ROMAR support; and following through with the H4 to match the Daily ROMAR for the uptrend. The sequence began on the 22nd with the Hit on the H4 ROMAR. This is when the H1 had crossed EMA for the up. And through this processes ROMAR had continued sliding under EMA.

The H4 ROMAR had become resistance with the H4 Parabolic as support in a ranging mode. This also had created a Wedge for the ROMAR sequence in following through with all four charts in sequence with the Daily ROMAR uptrend.

Since I made this posting above traders still looking for the shorts on their trading plans. My thoughts were - "What is going on" - after I had stated: "And this will continue until the Sequence is in order for a breakout." This means all trades are long for the breakout.

Yesterday the H2 ROMAR crossed EMA going up. Today H4 ROMAR crossed EMA going up. We are now in sequence with the Daily ROMAR uptrend; and out of consolidation with ROMAR. With Sunday's opening we have the Daily 61.8 as resistance.

+++++

Very interesting with the sequence breakout. It just now created a double top on the H2. The Jackson Hole Summit had done a number with this up so we will see if the double top holds.

shinny:

# Hello Traders

I just thought I would do a post and highlight today's market activity, in case it helps anyone. When I did my plan last night before I went to bed, I noted a few important things:

- 1) On the 2hr the DB/SAR were both showing ie the SAR came from a different point from the DB - so the next connection is going to be a DB/SAR on the top.
- 2) On the 4hr the market had crossed ROMAR as has EMA - the Rule that Dana mentioned and I also mentioned after was that the market would return to ROMAR.
- 3) I also noted the rising MACD on the 2hr
- 4) On the Daily, Smooth/Purple had crossed, PSAR was flipping and also EMA/MACD arrows are in order for the down - but the SAR itself has attached on the Daily.

When I went to bed last night I knew exactly what trade I was going to take, and exactly where the market would go. And please do not think that statement is arrogance - it is far from it. Its simply knowing the scenarios and also the sequences of what occur with the Paradox System.

Here is a picture I took this morning:

Obviously, what that shows is the SAR attached, but it also shows the EMA/MACD arrows in the correct order for a deeper move north. This is also where I took my entry. I had 40 pips to 2hr ROMAR and about 35 to 4hr ROMAR.

What was going to happen next (and did happen) was the DB/SAR to connect higher, but unfortunately I was out and couldn't take the pic.

Anyway, I took another pic not long ago, which showed this:

That shows mid-candle the DB/SAR running separately, which with the market going higher again is now back to the DB/SAR.

The 4hr has remained with the SAR attachment, and its pretty deep into the pullback, so this could be interesting.

Here is the print:

#	DE35794833	EURJPY	Buy	06/09/2017 17:01:08.508	129.808	130.210	43.2
---	------------	--------	-----	-------------------------	---------	---------	------

So my point here is that I knew last night that I wouldn't be shorting on the SAR, which I am guessing some of you have done, but I was looking for the long.

Pretty amazing system, eh?

dove\_alliance :

Quoting maas

A question: EMA is above Romar in all four time periods, does that not mean that only long trades should be taken? ATB, Maas

That all depends in how the scenario is applied with the rules for the scenario. Your question is:

does that not mean that only **long** trades should be taken?

You have ROMAR as the UPTREND for all the charts which means you trade the trend and the answer is yes; provided EMA is also in the uptrend with ROMAR. If EMA is counter of ROMAR then you are in consolidation. This means you do not counter-trade ROMAR when ROMAR is in full blown uptrend or vice-versa for the short - UNLESS - YOU CATCH THE TOP GOING SHORT - OR THE BOTTOM FOR THE LONG. In other words: You never, ever trade from CENTER.

I hope this help you AND - the others that were late for dinner.

[illegible]

Oct 6, 2017 - pg 567

dove\_alliance :

I had a trader ask me why I have a rule for 40/40 as there are trades could be taken for 60 or 80 pips? My answer was this:

"What is the reason why traders lose money?"

There are several reasons - such as not creating trading plans; not using SL/TP; but mostly not using "reward/risk ratio" which is also known as "greed".

So what is reward/risk ratio?

If you risk losing the same number of pips as you hope to gain, then your reward/risk ratio is 1-to-1 (also written 1:1). And this is why you have the 40/40 rule. If you target a profit of 80 pips with a risk of 40 pips, then you have a 2:1 reward/risk ratio. I always recommend in using a minimum of 1:1 ratio. That way, if you are right only half the time, you will at least break even.

Once you have a trading plan that uses a proper reward/risk ratio, the next challenge is to stick to the plan. Remember, it is natural for humans to want to hold on to losses and take profits early, but it makes for bad trading habits. We must overcome this natural tendency and remove our emotions from trading. The best way to do this is to set up your trade with Stop-Loss and Limit orders from the beginning.

The number one reason traders go bankrupt is greed. So many times I had seen traders ride a losing trade until they were bankrupt. Their emotions would not let them close a losing trade; believing it will turn before going broke. Unfortunately – they went broke.

The 40/40 rule protects you from such greed. Every rules for trading on this thread is for a "safe haven" in protecting your every trade and money.

The actual distance you place your stops and limits will depend on the conditions in the market at the time, such as volatility, currency pair, and where you see support and resistance. You can apply the same reward/risk ratio to any trade. If you have a stop level 40 pips away from entry, you should have a profit target 40 pips away. Example: If you have a stop level 100 pips away, your profit target should be at least 100 pips away. This example is used in trading the Daily chart. You always use the reward/risk ratio 1:1 on all of your trades.

Using B/E is also a mindset of greed. You cannot learn to trade in using B/E. If you learn how to trade properly then you will never need B/E. Once you had hit a level of 80% in using the reward/risk ratio of 40/40; then you are ready to trade live, and not before then.

[illegible]

Oct 11, 2017 - pg 570

dove\_alliance :

Most problems I am seeing with entries is not recognizing the Daily chart support and resistance. I see you had placed these support and resistance on your trading plans but you are not recognizing them on your final notes; **and planning your entry with the Daily**. Right now the Daily is off balance with the lower charts. You have ROMAR up and the 4 Horsemen down with EMA. I also notice you guys are not using the DB and SAR for your entries. In trend they both ride the trend but in consolidation they both become a heavy weapon for entries.

### SCENARIO 1:

What I am seeing is trading the 4 Horsemen in consolidation, and that is a mistake. In consolidation the 4 Horsemen swings and does not trend, and that is when the SAR comes into play for all of your entries while in consolidation. There will be times you might get in early with the SAR but once it is locked in then your 40 TP will be hit. If you trade from center with the H2 SAR in confluence 20-30 pips of your entry then count on a loser. You must be on top of the SAR before the market moves 10+ pips before pulling the trigger while in consolidation.

## SCENARIO 2:

But here is what everyone is missing and that is the DB. You never, ever trade opposite of the DB with the SAR. If the DB is on the bottom and SAR is on top then you wait on the SAR to reattached on the bottom for entry and true vice-versa. If both the the DB/SAR are attached together on top then you wait for a red bar before entry; and vice-versa with a green bar going long. **THIS SCENARIO IS TRUE FOR BOTH CONSOLIDATIONS AND TRENDS.**

+++++

80% of the market is consolidation. 10% is economic news and 10% is trend. You are in trend when the H2 and Daily are in sync for the trend with ROMAR, EMA, and the 4 Horsemen. If any of the 3 are not in sync with H2 and the Daily then you are in consolidation. Now you know when you are in trend.

[illegible]

Oct 12, 2017 - pg 572

dove\_alliance :

OK Traders - I am giving you one more chart to study which is the Daily. The Daily chart is the most significant chart in referencing the trend. It literally tells you a story in how to trade the H2. This chart is spread out in showing the swing for the uptrend. Looking at the DB you will see that each swing goes lower and then higher high following the ROMAR trend. The SAR takes control on each low and high swing and then reconnects with the DB on the bottom back into the trend. If you are not using the Daily as reference for the trend in using the DB/SAR is the reason why you are losing your trades. And basically - you traders are not referencing the Daily properly.

Bottom line - the Paradox does not allow short-cuts with your trading plans. You must see the whole picture before you can even think of pulling the trigger.

[illegible]

Oct 13, 2017 - pg 573

dove\_alliance :

This tutorial is about the sequence of the DB/SAR on the 3 trading charts, the H2 , H4, and the Daily. I have noticed traders using the H1 with indicators especially the DB and SAR. I have made it very clear throughout this thread the H1 is not a trading chart and is not to be used as a trading chart. The ONLY reason the H1 is with this system is for the use of the Period Converter for the H2; and I have posted many times the only thing should be showing on the H1 is the basic (Paradox\_Purple and the Paradox\_ROMAR) with the Converter. If you are trading the H1 then it is your lost.

Lets now move on – the charts below is showing you exactly what is happening into the future. And when I originally posted the question everyone was including other indicators - but the question was to do with the DB/SAR only.

On the H2 we have the DB attached on Bottom at price level 132.737; with the SAR attached on the Bottom at price level 132.737 with the hit on ROMAR...

On the H4 we have the DB attached on Top at price level 133.486; with the SAR attached on the Bottom at price level 132.737 heading for ROMAR...

On the Daily we have the DB attached on Top at price level 134.392; with the SAR attached on Top at price level 133.486 with roughly 250 pips to ROMAR...

The DB is your primary source of information in which way the market is moving; and/or - where the market will end up at.. Using the 4 Horsemen and Divergence properly on the H2 will tell you when the DB has ended the trend with reference of the H4 as verification

### The H2 Trading Chart:

The Uptrend:

The SAR will get you into a trade in the direction of the DB. If the DB is on the bottom then the SAR must also connect on the bottom as the market is moving in the uptrend. As the market is moving in an uptrend then the SAR will attached on top with the DB on the bottom – then the SAR will reattached on the bottom for the the uptrend and this is where you enter for the DB uptrend.

The Downtrend:

It is the very same scenario as an uptrend but reverse the SAR to the top for entry.

The Magic Bullet:

Now – the magic bullet for this scenario is ROMAR and the Parabolic. With this scenario - ROMAR must be the uptrend with the Parabolic's in order for the SAR to breakaway from the DB; and vice-versa for the downtrend. On the DB uptrend the SAR will breakaway to the top and your entry is when the SAR reattaches on the bottom. On the DB downtrend the SAR will breakaway to the bottom and entry is when the SAR reattaches on the top.

Consolidation:

Both the DB and SAR will attached together in all swing reversals..

If you get the 4 Horsemen opposite of the ROMAR trend on the H2 you will get both the DB and SAR running together.

Once you get either the DB or SAR locked in then they are set in stone. Either one or both will move from bar to bar in trend. If the high or low is retested then the DB and/or the SAR will reconnect with the new high or low.

### The H4 Chart:

The H4 has 6 bars in a 24 hour period and is longer term which means the DB can freeze for days before reconnecting. This also means the H2 can reconnect before the H4. This is one reason why the H2 is your trading chart and you have a 40/40 reward/risk ratio. There are times the H2 will signal the SAR and the H4 does not. So – always trade the H2.

But there is one scenario you have to determine on your trading plan, And that is the direction of the DB and SAR on your H4. As you look on the H4 above you will see on the left of the chart with the DB and SAR connected on the bottom. The next connection with the SAR is above ROMAR/Parabolic on top at 132.754. With this connection you would know the next connection is on the bottom to reconnect for an entry going long with the DB uptrend. That is a long wait for the re-connection; which means you have to catch the top above ROMAR and the Parabolic resistance to get your TP. In this scenario means you have to always be focus what is happening within The Paradox.

### The Daily Chart:

The Daily is a one 24 hour bar which means the DB can freeze for weeks; and the SAR for many days into a week or more. All you need to do is always keep track of the DB and SAR with the Daily on your trading plans. Always know the direction of both and plan your entries accordingly.

Now – let me plot this altogether with the 3 charts above:

The Daily is telling you with Both the DB and SAR on top of separate bars that the next connection for both is on the BOTTOM. But the question is: WHEN??

The answer begins with the flip of ROMAR on the H1, H2, and the H4. At the time of this writing these three charts ROMAR's are support. The transition will begin on the H1 ROMAR crossing EMA. Once it begins then the Daily ROMAR will be the target. The H1 and H2 will consolidate at ROMAR until the H2 gets below ROMAR with EMA crossing and then the H4 will be next; and then moving on for the Daily ROMAR hit.

Before the market hits the Daily ROMAR both the H2 and H4 will have both the DB and SAR traveling together as one unit to the Daily ROMAR. Once the Daily is hit a decision will be made with the Daily DB if it remains on the Top frozen or hit Bottom with ROMAR and the SAR.

The Paradox is the most powerful system in the world. All you need to do is learn how to trade it. If you spend your free time studying this tutorial in back testing the DB/SAR on your charts, then eventually a light bulb will turn on and the light will shine.

There are no short-cuts in learning anything. If you set aside your baggage and place your heart and mind into learning then the market belongs to you.

Oct 20, 2017 - pg 577

## Hendo

Hello Dana, Shaun, and fellow traders,

I don't see any posted entries for today so, I thought I would share my plan and entry with EU. If you are new to the thread or still learning please continue to post with regards to the EJ only! I hope it helps any one who may be struggling.

Trade well,

Chad

Session Sydney: EUR-USD 10/19/2017

Daily: Open at previous day close.

ROMAR: Support

EMA: Support

Parabolic: Eliminated

Notes: Purple crossed White and Smooth down. EMA holding support. DB / SAR up with Magenta and Green Divergence attach at 50.0 FIBO. SAR attach down below 23.6 FIBO. Trend EMA arrow up. MACD zero cross arrow up. FIBO up.

H2

ROMAR: Support

EMA: Support

Parabolic: Eliminated

Notes: Purple crossed White and Smooth down. DB / SAR up with Magenta and Green Divergence attach at 0.0 FIBO. SAR attach for the up at 38.2 FIBO just above ROMAR. Trend EMA arrow down. MACD zero cross arrow down. FIBO down.

H1

ROMAR: Support

EMA: Resistance

Parabolic: Resistance

Notes: EMA crossed Purple, White down.

Final Notes: H1 turning down with ROMAR holding support. H2 turning down with ROMAR holding support. Daily in consolidated up, trend with EMA holding support. Market is in a consolidated up, trend. H2 and Daily DB / SAR on top with Green and Magenta Divergence attached, next DB connections must be down. H2 lower BB is inside FIBO 69 pips down from entry as target for the market. I will enter short position on H2 04:00 open candle below PSAR.

Adjustments:

Short: Entered short position on H2 04:00 open candle 3 pips below PSAR. Set TP +40 SL 40.

Result: Took +40 from the market.

[illegible]

Oct 24, 2017 - pg 580

dove\_alliance :

Let me go through something I have posted many times with ROMAR sliders:

ROMAR sliders are created

**without  
t**

the Purple crossing. You can verify the ROMAR crossing EMA beginning with the H1 as verification. If ROMAR crosses Purple on the HI then ROMAR becomes both Support and Resistance on the H1; this is also true on all charts. It is also the beginning of the sync for ROMAR to change trend direction.

Lets take yesterday's scenario with the uptrend from the bottom.

Once ROMAR crosses Purple and this is on ANY CHART; and the market **does not** get below ROMAR for the uptrend then the market will stay in the original trend. If the Market gets below ROMAR as it did yesterday on the H1 then ROMAR will cross EMA. On the H2 the market stayed above ROMAR for the Purple slider and kept the new trend up from the bottom. If the market had gotten below the H2 ROMAR then ROMAR would have crossed Purple and then move on to EMA for the ROMAR sync in changing the trend. This is called a "Purple slider".

Now - lets talk about the "EMA Slider":

Always remember once ROMAR crosses Purple then ROMAR becomes both Support and Resistance. This means if the Market gets below ROMAR and is not at EMA for the crossing then the market will return back above ROMAR and become an EMA slider. ROMAR MUST cross EMA to change the direction of the trend.

As you notice on the H2 chart from yesterday's opening you will see the Market opened below ROMAR; then return back above ROMAR, and stayed intact for the Purple/EMA slider.

What I had described above are the Rules for the ROMAR sliders. And traders - these rules are visible and should never be missed on your trading plans..

[illegible]

Oct 25, 2017 – pg 581

Hendo

Hello Traders,

The seemingly daily unscheduled news releases coming from the White House and Washington, is keeping me out of the EU. So I'm switching back to the EJ for a while.

I noticed a couple of you took this trade. I just got in a little sooner. It did go down a little further but, not more than about 7 pips. Here is my plan with entry, offering a slightly different perspective.

Hope it helps,

Chad,

Session Sydney: EUR-JPY 10/24/2017

Daily: Open above Purple.

ROMAR: Support

EMA: Support

Parabolic: Support

Notes: Horsemen up. DB / SAR up with Magenta and Green Divergence attach below 0.0 FIBO. Trend EMA arrow up. MACD zero cross arrow up. FIBO down.

H2

ROMAR: Support

EMA: Support

Parabolic: Eliminated

Notes: Horsemen up Purple, in slider with White down. DB / SAR up with Magenta Divergence attach at 0.0 FIBO. Trend EMA arrow up. MACD zero cross arrow up. FIBO down.

H1

ROMAR: Support

EMA: Support

Parabolic: Eliminated

Notes: Purple in tight with White and Smooth down. EMA holding support.

Final Notes: H1, H2, and Daily in sync with up, trend. H2 and Daily, BB's opening up, for the market to continue long. Market is in a consolidated up, trend. I will enter long position off H2 support. Looking for H2, SAR hit around EMA, to reenter up, trend.

Adjustments:

Long: Entered long position on H2, 0:00 mid candle SAR hit below EMA at 38.2 FIBO. Set TP +40 SL 40.

Result: Took +40 from the market.
