

Steve Hopwood's Super_Signal auto trading robot

This robot needs the Super_Signal_v3f_-_fixed_dista.mq4 indicator in your Experts|Indicators folder. You will find it in the zip you downloaded. You do not need it on your chart.

This robot is a single pair trader, so you need an instance on a chart for each pair you wish to trade.

The robot's trading strategy:

- M15 chart.
- Use Rsi D1, 21 period, to ascertain the trend:
 - >55: trend is up
 - <45: trend is down
 - 45-55: market is ranging or changing direction.
- Only trade when current Rsi is also on the right side of the D1 i.e. lower in a down trend etc
- Wait for a strong signal in the direction of the trend. This is generated by the Super Signal indi.
- tp/sl 100(0) pips. You should also consider using my Multi-Purpose Trade Manager (universally referred to as mptm) to set jumping stops and breakeven points – follow the link in my FF signature to find it..

The robot automatically adjusts tp/sl for 4 digit criminals. 4 digit account holders need to multiply their inputs by 10.

CandleShift tells the robot which candle to examine for a signal. The further back you look, the more reliable the signal but the later you will get into the trade.

- 0 = current
- 1 = previous
- 2 = 2 candles ago, etc

Any value >0 means the robot will only look for trading ops at the opening of each candle.

Don't ask me what the indi inputs mean; not a clue.
